SCRUM-1

Search filter returns all products instead of "No results found" for unrecognized keyword "ABCXYZ"

Description

When a user searches for "ABCXYZ" using the search bar, the search filter fails to process the input and returns the entire product catalog instead of showing a "No results found" message. This misleads users into thinking all products are somehow related to their search, making the search feature unreliable and untrustworthy — users may assume the store has no search capability at all.

Steps to Reproduce

1. Open `StackDemo` in Chrome.
2. Click on the search bar at the top of the page.
3. Type `ABCXYZ` in the search field.
4. Click the search button.

Actual result: The search filter ignores the keyword "ABCXYZ" and displays the full product catalog including all Samsung, Apple, and Google devices.

Expected result: A "No results found" message (or equivalent empty state) should be displayed since no products match the keyword "ABCXYZ".

Search filter not working — "iPhone 12" shows all products instead of filtered results

Description

When a user searches for "iPhone 12" using the search bar, the search filter fails to process the input and returns the entire product catalog (including Samsung, Google, and OnePlus devices) instead of only matching iPhone 12 results. This prevents users from finding specific products efficiently, which could lead to user frustration and drop-offs, especially on a product listing page where search is the primary navigation tool.

Steps to reproduce:

1. Open `StackDemo` in Chrome.
2. Click on the search icon/bar.
3. Type: `iphone 12`
4. Click the search button.

Actual result: All products from the catalog are displayed — including Samsung and Google devices. The search has no effect.

Expected result: Only products matching "iPhone 12" should be displayed.

Search filter returns all products instead of "No results found" for special characters "@#\$\$%"

Description

When a user enters special characters "@#\$\$%" in the search bar, the search filter fails to process the input and returns the entire product catalog instead of showing a "No results found" message. This makes the search feature behave inconsistently — users entering accidental or invalid characters receive no feedback, making the search appear broken rather than helpful.

Steps to reproduce:

1. Open StackDemo in Chrome.
2. Click on the search bar at the top of the page.
3. Type @#\$\$% in the search field.
4. Click the search button.

Actual result: The search filter ignores the special characters "@#\$\$%" and displays the full product catalog including all Samsung, Apple, and Google devices.

Expected result: A "No results found" message should be displayed since no products match the special character input "@#\$\$%".

Favourited product disappears from Favourites page after user logs in

Description

When a user adds a product to Favourites before logging in and then completes login, the favourited product is not saved — the Favourites page appears completely empty after login. This is a critical issue because the Favourites feature exists specifically to let users save products across sessions. Losing saved items after login breaks the core purpose of the feature and directly damages user trust and retention.

1. Open [StackDemo](#) in Chrome.
2. Without logging in, find the product `iPhone 12` on the home page.
3. Click the Favourites icon on the iPhone 12 product card to add it to Favourites.
4. Observe that the app redirects to the login page.
5. Enter the following credentials:
 - Username: `fav_user`
 - Password: `testingisfun99`
6. Click the Login button.
7. Navigate to the Favourites page after successful login.

Actual result: The Favourites page is completely empty. The iPhone 12 that was added to Favourites before login is missing — it has not been carried over after authentication.

Expected result: The iPhone 12 added to Favourites before login should be visible on the Favourites page after successful login, since the app itself redirected the user to login when they attempted to favourite the product.
